

# Angled Graphics Card Kit 4.0

Installing a new graphics card can provide a whole new gaming experience. With the Angled Graphics Card Kit 4.0, this experience gets a new perspective: The rotated installation of the graphics card brings its visual features into full view, and, at the same time, the kit's modern PCIe 4.0 standard enables super-fast data transfer.

## Visual Highlights in a New Perspective

The Angled Graphics Card Kit allows the graphics card to be installed at a new angle with the fans facing toward the side panel. The fans are therefore fully visible. Particularly eye-catching fans or an impressive illumination will visually come into their own. The kit has been specially designed for our REV300 case to make impressive builds even more possible.

## Maximum Speed

The Angled Graphics Card Kit can be installed in just a few steps. The mounting bracket is attached to the mainboard tray, while the riser cable connects the mainboard and the graphics card. The cable has a PCIe 4.0 specification, transferring data at a super-fast 252 Gbit/s.
